

Individual Grade Adjustment

The individual project grade is computed as:

$$G_{\text{individual}} = G + P, \quad P \in [-1, +1]$$

where G is the **group grade** (from the rubric above) and P is a **peer adjustment** derived from an anonymous peer evaluation survey.

Peer evaluation. After submission, each student privately rates their 9 teammates on three criteria using a 1–5 scale:

- *Reliability*: Did they meet internal team deadlines?
- *Quality of work*: Did their contributions meet the team’s standards without requiring constant rework by others?
- *Communication*: Did they attend meetings and respond to messages?

Smooth mapping. Let $\bar{S} \in [1, 5]$ be the student’s average peer score across all teammates and all criteria. The adjustment is:

$$P = \frac{\bar{S} - 3}{2}$$

$\bar{S}$	1.0	1.5	2.0	2.5	3.0	3.5	4.0	4.5	5.0
P	−1.0	−0.75	−0.5	−0.25	0	+0.25	+0.5	+0.75	+1.0

Safeguards.

- Students giving a score of ≤ 1.5 , **must** provide a written justification.
- In case of disputed or highly polarized reviews, the teaching team will use the public **Contribution List** on the report cover page and an oral check to make a final determination.
